

0.1 广义函数的运算

定义 0.1

设 $A : \mathcal{D}(\Omega) \rightarrow \mathcal{D}(\Omega)$ 为线性算子, 若

$$\varphi_j \rightarrow \varphi(\mathcal{D}(\Omega)) \implies A\varphi_j \rightarrow A\varphi(\mathcal{D}(\Omega)) \quad (j \rightarrow \infty),$$

则称 A 是连续线性算子.

例题 0.1 任意微分算子 ∂^α 是 $\mathcal{D}(\Omega)$ 上的连续线性算子.

证明 Show/Hide Proof

对任意相对紧集 $K \subseteq \Omega$, 有 $\partial^\alpha : \mathcal{D}_K \rightarrow \mathcal{D}_K$, 且

$$\|\partial^\alpha \varphi\|_m = \sum_{|\beta| \leq m} \max_{x \in K} |\partial^{\beta+\alpha} \varphi(x)| \leq \|\varphi\|_{m+|\alpha|}.$$

∂^α 在 $L^2(\Omega)$ 上不连续, 但为闭算子.

□

例题 0.2 设 $\psi \in C^\infty(\Omega)$, 定义乘法算子 $A : \varphi \mapsto \psi \cdot \varphi$ ($\forall \varphi \in \mathcal{D}(\Omega)$), 则 A 是连续线性算子.

证明 Show/Hide Proof

对任意相对紧集 $K \subseteq \Omega$, 有 $A : \mathcal{D}_K \rightarrow \mathcal{D}_K$, 且

$$\begin{aligned} \|\psi \cdot \varphi\|_m &= \sum_{|\alpha| \leq m} \max_{x \in K} |\partial^\alpha (\psi \cdot \varphi)(x)| \\ &\leq \sum_{|\alpha| \leq m} \max_{x \in K} \left| \sum_{\beta \leq \alpha} \binom{\alpha}{\beta} \partial^\beta \psi(x) \cdot \partial^{\alpha-\beta} \varphi(x) \right| \\ &\leq C(m, \psi) \|\varphi\|_m. \end{aligned}$$

□

定义 0.2

对 $\mathcal{D}(\Omega)$ 上的线性算子 A , 在 $\mathcal{D}'(\Omega)$ 上定义其共轭算子 A^* 满足

$$\langle A^* f, \varphi \rangle = \langle f, A\varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\Omega), \forall f \in \mathcal{D}'(\Omega)).$$

命题 0.1

$A^* : \mathcal{D}'(\Omega) \rightarrow \mathcal{D}'(\Omega)$ 为连续线性算子.

证明 Show/Hide Proof

若 $f_j \rightarrow f$ ($\mathcal{D}'(\Omega)$), $j \rightarrow \infty$, 则对 $\forall \varphi \in \mathcal{D}(\Omega)$, 有

$$\langle A^* f_j, \varphi \rangle = \langle f_j, A\varphi \rangle \rightarrow \langle f, A\varphi \rangle = \langle A^* f, \varphi \rangle \quad (j \rightarrow \infty),$$

即 $A^* f_j \rightarrow A^* f$ ($j \rightarrow \infty$).

□

0.1.1 广义微商

定义 0.3

称 $\tilde{\partial}^\alpha = (-1)^{|\alpha|}(\partial^\alpha)^*$ 为 α 阶广义微商运算, 即对 $\forall f \in \mathcal{D}'(\Omega)$,

$$\langle \tilde{\partial}^\alpha f, \varphi \rangle = (-1)^{|\alpha|} \langle f, \partial^\alpha \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\Omega)).$$

注 若 $f(x) \in C^1(\Omega)$, 其按自然对应 $\langle f, \varphi \rangle = \int_{\Omega} f(x)\varphi(x)dx$ ($\forall \varphi \in \mathcal{D}(\Omega)$) 生成广义函数. 其广义微商 $\tilde{\partial}_{x_i} f$ 与普通微商 $\partial_{x_i} f$ 对应的广义函数一致, 因

$$\langle \tilde{\partial}_{x_i} f, \varphi \rangle = -\langle f, \partial_{x_i} \varphi \rangle = -\int_{\Omega} f(x)\partial_{x_i} \varphi(x)dx = \int_{\Omega} \partial_{x_i} f(x)\varphi(x)dx \quad (\forall \varphi \in \mathcal{D}(\Omega)).$$

注 广义函数对微商运算封闭: 任意 $f \in \mathcal{D}'(\Omega)$ 可做任意次广义微商. 局部可积函数未必存在普通微商, 但作为广义函数总存在广义微商, 且广义微商为广义函数, 未必是普通函数.

注 对任意多重指标 α, β , 有

$$\tilde{\partial}^\alpha \cdot \tilde{\partial}^\beta = \tilde{\partial}^{\alpha+\beta} = \tilde{\partial}^\beta \cdot \tilde{\partial}^\alpha.$$

注 广义微商算子连续, 故

$$f_j \rightarrow f_0 \quad (j \rightarrow \infty) \implies \tilde{\partial}^\alpha f_j \rightarrow \tilde{\partial}^\alpha f_0 \quad (j \rightarrow \infty),$$

即广义微商与极限运算可交换.

命题 0.2

1. 若 $Y(x) = \begin{cases} 1, & x > 0, \\ 0, & x \leq 0, \end{cases}$ 则 $\tilde{\partial}_x Y(x) = \delta(x)$.
2. 设 $\delta^{(\alpha)}$ 为 α 阶 δ 广义函数, 则 $\tilde{\partial}^\alpha \delta = \delta^{(\alpha)}$.
3. 记 $\tilde{\Delta} = \tilde{\partial}_{x_1}^2 + \cdots + \tilde{\partial}_{x_n}^2$, 则

$$\tilde{\Delta}|x|^{2-n} = (2-n)\Omega_n\delta(x) \quad (n \geq 3),$$

$$\tilde{\Delta} \ln|x| = 2\pi\delta(x) \quad (n=2),$$

其中 Ω_n 为 $\mathbb{R}^n$ 中单位球面的面积.

证明 Show/Hide Proof

(1) 注意到

$$\begin{aligned} \langle \tilde{\partial}_x Y, \varphi \rangle &= -\langle Y, \partial_x \varphi \rangle = -\int_0^\infty \varphi'(x)dx \\ &= \varphi(0) = \langle \delta, \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R})). \end{aligned}$$

(2) 注意到

$$\begin{aligned} \langle \tilde{\partial}^\alpha \delta, \varphi \rangle &= (-1)^{|\alpha|} \langle \delta, \partial^\alpha \varphi \rangle \\ &= (-1)^{|\alpha|} (\partial^\alpha \varphi)(0) = \langle \delta^{(\alpha)}, \varphi \rangle. \end{aligned}$$

(3) (i) 当 $n \geq 3$ 时, 对 $\forall \varphi \in \mathcal{D}(\mathbb{R}^n)$,

$$\langle \tilde{\Delta}|x|^{2-n}, \varphi \rangle = \langle |x|^{2-n}, \Delta \varphi \rangle = \lim_{\varepsilon \rightarrow 0} \int_{|x| \geq \varepsilon} |x|^{2-n} \Delta \varphi(x) dx$$

$$\stackrel{\text{Green 公式}}{=} \lim_{\varepsilon \rightarrow 0} \left[\int_{|x| \geq \varepsilon} \Delta |x|^{2-n} \varphi(x) dx + \int_{|x|=\varepsilon} \left(\varphi \frac{\partial |x|^{2-n}}{\partial r} - |x|^{2-n} \frac{\partial \varphi}{\partial r} \right) d\sigma \right].$$

因 φ 具有紧支集, 可取充分大的球 $B(\theta, R) = \{x \in \mathbb{R}^n \mid |x| < R\}$ 使得 $\text{supp}(\varphi) \subseteq B(\theta, R)$. 注意到 $\Delta |x|^{2-n} = 0$ ($|x| \neq 0$), $\varepsilon^{2-n} \int_{|x|=\varepsilon} \frac{\partial \varphi}{\partial r} d\sigma = O(\varepsilon) \rightarrow 0$ ($\varepsilon \rightarrow 0$), 且 $\varepsilon^{1-n} \int_{|x|=\varepsilon} \varphi(x) d\sigma \rightarrow \varphi(0)\Omega_n$ ($\varepsilon \rightarrow 0$),

故

$$\langle \tilde{\Delta}|x|^{2-n}, \varphi \rangle = (2-n)\varphi(0)\Omega_n = (2-n)\Omega_n \langle \delta, \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)).$$

(ii) 当 $n=2$ 时, 同理可证

$$\langle \tilde{\Delta} \ln |x|, \varphi \rangle = 2\pi \langle \delta, \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^2)).$$

□

0.1.2 广义函数的乘法

定义 0.4

对 $\forall \psi \in C^\infty(\Omega), \forall f \in \mathcal{D}'(\Omega)$, 定义广义函数的乘法满足

$$\langle \psi f, \varphi \rangle = \langle f, \psi \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\Omega)).$$

♣

命题 0.3

广义函数与 $C^\infty(\Omega)$ 函数的乘法算子为连续算子.

♣

例题 0.3

$$x^n \tilde{\partial}^m \delta(x) = \begin{cases} (-1)^n \frac{m!}{(m-n)!} \delta^{(m-n)}(x), & m \geq n, \\ 0, & m < n. \end{cases}$$

证明 Show/Hide Proof

$$\begin{aligned} \langle x^n \tilde{\partial}^m \delta(x), \varphi(x) \rangle &= (-1)^m \langle \delta(x), \partial^m (x^n \varphi(x)) \rangle \\ &= (-1)^m \sum_{r=0}^m \binom{m}{r} (\partial^r x^n) (\partial^{m-r} \varphi(x)) \Big|_{x=0} \\ &= \begin{cases} \frac{(-1)^m m! n!}{n!(m-n)!} (\partial^{m-n} \varphi)(0), & m \geq n, \\ 0, & m < n \end{cases} \\ &= \begin{cases} (-1)^n \frac{m!}{(m-n)!} \langle \delta^{(m-n)}(x), \varphi \rangle, & m \geq n, \\ 0, & m < n. \end{cases} \end{aligned}$$

□

注 当 $f \in L^1_{\text{loc}}(\Omega)$ 时, ψf 的普通函数乘法定义与广义函数乘法定义一致. 一般不能定义两个广义函数的乘积, 如两个 δ 函数相乘, 结果不再是广义函数.

0.1.3 平移算子与反射算子

定义 0.5

对 $\forall x_0 \in \mathbb{R}^n$, 定义**平移算子** $\tau_{x_0} : \mathcal{D}(\mathbb{R}^n) \rightarrow \mathcal{D}(\mathbb{R}^n)$ 满足

$$(\tau_{x_0} \varphi)(x) = \varphi(x - x_0) \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)).$$

♣

定义 0.6

定义广义平移算子 $\tilde{\tau}_{x_0} \triangleq (\tau_{-x_0})^*$, 即对 $\forall f \in \mathcal{D}'(\mathbb{R}^n)$,

$$\langle \tilde{\tau}_{x_0} f, \varphi \rangle = \langle f, \tau_{-x_0} \varphi \rangle = \langle f, \varphi(x + x_0) \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)).$$

♣

注 $\tilde{\tau}_{x_0}$ 是普通平移算子的推广: 若 $f(x) \in L^1_{\text{loc}}(\mathbb{R}^n)$, 则

$$\int_{\mathbb{R}^n} f(x - x_0) \varphi(x) dx = \int_{\mathbb{R}^n} f(x) \varphi(x + x_0) dx = \langle f, \tau_{-x_0} \varphi \rangle = \langle \tilde{\tau}_{x_0} f, \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)),$$

即 $\tilde{\tau}_{x_0} f = f(x - x_0) = \tau_{x_0} f$.

定义 0.7

定义反射算子 $\sigma: \mathcal{D}(\mathbb{R}^n) \rightarrow \mathcal{D}(\mathbb{R}^n)$ 满足

$$(\sigma \varphi)(x) = \varphi(-x) \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)).$$

♣

定义 0.8

定义广义反射算子 $\tilde{\sigma} \triangleq \sigma^*$, 即对 $\forall f \in \mathcal{D}'(\mathbb{R}^n)$,

$$\langle \tilde{\sigma} f, \varphi \rangle = \langle \sigma^* f, \varphi \rangle = \langle f, \sigma \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)).$$

♣

注 $\tilde{\sigma}$ 是普通反射算子的推广: 若 $f(x) \in L^1_{\text{loc}}(\mathbb{R}^n)$, 则

$$\int_{\mathbb{R}^n} f(-x) \varphi(x) dx = \int_{\mathbb{R}^n} f(x) \varphi(-x) dx = \langle f, \sigma \varphi \rangle = \langle \tilde{\sigma} f, \varphi \rangle \quad (\forall \varphi \in \mathcal{D}(\mathbb{R}^n)),$$

即 $\tilde{\sigma} f = f(-x) = \sigma f$.

例题 0.4 计算:

- (1) $\tilde{\partial}_x^n |x|$;
- (2) $\tilde{\partial}^n x_+^\lambda (\lambda \in \mathbb{R}, \lambda \geq 0)$, 其中

$$x_+^\lambda = \begin{cases} x^\lambda, & x > 0, \\ 0, & x \leq 0. \end{cases}$$

例题 0.5 求证:

$$\frac{\tilde{d}}{dx} \ln |x| = \text{P.V.} \left(\frac{1}{x} \right),$$

即

$$\left\langle \frac{\tilde{d}}{dx} \ln |x|, \varphi \right\rangle = \lim_{\varepsilon \rightarrow 0+} \int_{|x| \geq \varepsilon} \frac{\varphi(x)}{x} dx \quad (\forall \varphi \in \mathcal{D}(\mathbb{R})).$$

例题 0.6 设 $\Omega = (\alpha, \beta) \subset \mathbb{R}, x_0 \in \Omega$, 又设 $f \in C^1(\Omega \setminus \{x_0\})$, x_0 是 f 的第一类间断点且 f' 在 $\Omega \setminus \{x_0\}$ 内有界. 求证:

$$\frac{\tilde{d}}{dx} f = f' + (f(x_0 + 0) - f(x_0 - 0)) \delta(x_0).$$

例题 0.7 求证: 对 $\forall f \in \mathcal{D}'(\mathbb{R}^n)$ 有

$$\tilde{\partial}_{x_i} f = \lim_{h \rightarrow 0} \frac{1}{h} (\tilde{\tau}_{-he_i} f - f),$$

其中

$$e_i = \underbrace{(0, \dots, 0, 1, 0, \dots, 0)}_i \quad (i = 1, 2, \dots, n).$$

例题 0.8 求证: 对 $\forall f \in \mathcal{D}'(\mathbb{R}^n)$, 以及 $\forall \varphi \in \mathcal{D}(\mathbb{R}^n)$, 函数

$$g(y) = \langle f, \tau_{-y} \varphi \rangle \in C^\infty(\mathbb{R}^n).$$

例题 0.9 求证: 每个 $f \in \mathcal{S}'$ 必是 $L^2(\mathbb{R}^n)$ 函数乘以多项式的广义微商之有限和, 即 $\exists u_\alpha \in L^2(\mathbb{R}^n)$ 及偶数 m , 使得

$$f = (-1)^{|\alpha|} \sum_{|\alpha| \leq m} \tilde{\partial}^\alpha [(1 + |x|^2)^{\frac{m}{2}} u_\alpha].$$

提示利用(??)式. (??)式中的 m 可以认为是偶数, 这是因为必要的话可在(??)式中用 $2m$ 取代 m .
